XL VIEW AUTO DARKENING WELDING HELMET
INSTRUCTIONS
EASTWOOD WELDING HELMETS are specifically designed to provide maximum eye and face protection from harmful UV and IR radiation emitted when welding, in a lightweight, comfortable housing. The Extra Large Viewing area provides additional visibility for added safety and convenience. Auto-Darkening powered by solar cells and Lithium #2032 batteries provide long, reliable life. Meets ANSI Z-87.1 safety standards.

SAFETY INFORMATION

The following explanations are displayed in this manual, on the labeling, and on all other information provided with this product:

⚠️ DANGER

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

⚠️ WARNING

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

CAUTION used with the safety alert symbol, indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

⚠️ NOTICE

NOTICE is used to address practices not related to personal injury.

⚠️ READ INSTRUCTIONS

- Thoroughly read and understand this manual before using.
- Save for future reference.
**WARNING** ELECTRIC SHOCK CAN CAUSE INJURY OR DEATH!

- Improper use of an electric welder and associated equipment can cause electric shock, injury and death! Read all precautions described in the specific Welder Manual to reduce the possibility of electric shock.

- The electrode and work (or ground) circuits are electrically “hot” when the welder is on. Do not allow these “hot” parts or associated equipment to come in contact with your bare skin or wet clothing.

- Separate yourself from the welding circuit by using insulating mats, protective clothing, leather welding gloves and insulated footwear to avoid being part of the welding circuit.

- Be sure that the work piece is properly supported and grounded prior to beginning an electric welding operation.

- If other persons or pets are in the area of welding, use welding screens to protect bystanders from sparks and harmful arc rays.

**WARNING** EYE INJURY HAZARD!

- If other persons or pets are in the area of welding, use welding screens to protect bystanders from sparks and harmful arc rays.

- Inadequate levels of arc ray shading can cause permanent eye injury. This helmet is capable of protection up to shade level 13 only. If your particular welding process emits arc radiation that requires a shade level higher than 13, DO NOT use this helmet and seek alternate protection.

- Eastwood welding helmets are designed to protect the user’s eyes and face from harmful radiation, sparks and spatter under normal welding conditions. They are not intended to offer protection against impact hazards, explosions or corrosive liquids.

- Wear ANSI approved impact safety goggles under welding helmet.

- Always test Auto-Darkening feature before each use by quickly subjecting the face of the Welding Helmet to sunlight or other bright light source. If the Auto-Darkening feature fails to function, permanent eye damage can occur from exposure to welding flash and radiation, DO NOT USE

- The operating temperature range of the Auto-Darkening feature is 23°F to 130°F (-5°C to 55°C). The response time may be affected beyond the described temperatures causing an unsafe condition. DO NOT USE beyond recommended operating temperature range.

- DO NOT USE this helmet for oxy-acetylene welding or cutting processes, laser welding or low amperage (less than 10 amps) TIG welding.
OPERATION

- Remove the protective film from the inside and outside surfaces of the lens.
- With normal (non-welding), ambient light, your view through the lens will have a slight tint. When exposed to bright light or the flash of the welding arc, the lens will quickly darken your view.

The Sensitivity, Delay and Shade controls and switches are located at the upper left side of the Welding Helmet and are adjustable as follows: (FIG 1)

SENSITIVITY
Sensitivity controls the Auto-darkening response when exposed to smaller arcs such as low-amperage TIG welding and conditions like welding outside in bright sunlight.

To Adjust Sensitivity: Turn dial Clockwise to increase sensitivity for low amperage welding. Turn Counter-Clockwise when welding in sunlight or bright ambient light.

DELAY
Delay controls the time interval for the Auto-darkening to return to normal view once arc is stopped.

To Adjust Delay: Turn dial Clockwise to increase delay time. Turn Counter-Clockwise to shorten the delay time.

---

**WARNING** EYE INJURY HAZARD!
- Inadequate levels of arc ray shading can cause permanent eye injury. This helmet is capable of protection up to shade level 13 only. If your particular welding process emits arc radiation at levels higher than 13, DO NOT use this helmet and seek alternate protection.
- Do not use this helmet for oxy-acetylene welding or cutting processes, laser welding or low amperage (less than 10 amps) TIG welding.

SHADE
Shade is used to control the level of darkness as Auto-darkening is automatically activated when an arc is present.

The Shade Control Knob is designed to function in 2 separate ranges; one for shade levels 5 through 9 and one for shade levels 9 through 13. Shade 5 is lightest while shade 13 is darkest. Move the Shade Range Switch down for levels 5-9; up for levels 9-13.
To Adjust Shade:

Consult the SHADE GUIDE TABLE (FIG 2) to verify that this helmet provides adequate protection for your preferred welding process before using.

If unsure of shade level required, use the following procedure to find the correct shade level:

- Set the Range Switch to the 9-13 position, set Knob to 13 and try viewing with an expected arc then continue to decrease the setting while striking an arc until it is visible with Auto-Darkening. This is the correct setting.

SMAW — Shielded Metal Arc Welding  MAG/C02 — Metal Active Gas
MIG (heavy) — MIG on Heavy Metals  SAW — Shielded Semi-Automatic Arc Welding
MIG (light) — MIG on Light Alloys  PAC — Plasma Arc Cutting
TIG, GTAW — Gas Tungsten Arc Welding  PAW — Plasma Arc Cutting

To Set Shade Control to “Grind”: Rotate the Shade Control Knob past the detent fully to the “GRIND” position which will lock the viewer on full transparency.

⚠️ WARNING ⚠️

To avoid serious and permanent eye damage, NEVER attempt to weld with the Shade Control set to “GRIND”.

ADJUST FIT OF HELMET

Headband – Push Knob in and Turn Clockwise to decrease size (tighten) or rotate Counter-Clockwise to increase size (loosen).

Width/Height – Push in rectangular latch on the two overhead bands, slide bands in to shorten band or pull out to lengthen bands. Snap button into the nearest available rectangular holes.

Flip-up Retention – This will allow the helmet to stay in the “flipped-up” position. Tighten or loosen knobs on either side of the helmet to increase or decrease friction.

MAINTENANCE

- The Red LED “Low-Bat” Indicator is located on the upper, inner panel above the viewing area and between the battery covers (Fig 3). If it is illuminated, the batteries may require a charge by exposing the face of the Welding Helmet to bright sunlight for several hours. If this fails to extinguish the light, the batteries will require replacement. If this becomes necessary, replace with two 3V type CR2032 by following the “Replace Batteries” section below.

REPLACE BATTERIES:
- Note location at upper inside of Helmet, grip raised rib of Battery Covers, rotate Battery Covers 20° Counter-Clockwise to the Unlocked position and remove Covers. (FIG 4).
- Remove Batteries.
- Replace Batteries with 3V type CR2032 with positive side facing upward.
- Replace Battery Covers and rotate Clockwise 20° to the locked position.

- Clean outside and inside of lens with a soft cloth and small amount of glass cleaner. **NOTE:** Do not use excessive glass cleaner or allow the lens assembly to become wet or the sensitive electronics will be destroyed. Never use solvents.
- Clean headband with a cloth dampened with mild soap and water. Allow to dry thoroughly.
- Check lens assembly for damage before each use. If cracked or broken, DO NOT USE.

REPLACE OUTER SHIELD:
- Insert tip of the forefinger into the semi-circular recess at the bottom of the viewing area, pry the Lens up while curling it outward in the center, then out and away from Helmet (FIG 5).
- Reverse to install by squeezing sides to curl the center outward then insert edges into channels around frame of opening (FIG 5).
